Data set

WI KIART ENCYCLOPEDIA

Data set

WI KIART ENCYCLOPEDIA

- ▶ We collect 300 images for *each* artist.
- ▶ We split into 240 for training, 30 for validation and 30 for testing.
- Folder structure:

- ▶ We use Keras with tensorflow backend to support neural networks.
- We use *Google Colaboratory* as our computing engine.
 - Free Tesla K80 GPU!
 - It is similar to Jupyter notebook:

First layer: it keeps almost all of the information in the initial image.

▲ロト ▲圖 ▶ ▲ 国 ▶ ▲ 国 ▶ ● のへで

Higher layers:

- activations become *abstract*, less information about the visual contents.
- the sparsity of the activations increases.

Well, the result is okay, but definitely not perfect, is it?

Transfer learning

In our case:

- Trained convolutional base: VGG16
- New classifier: Softmax.

Transfer learning with VGG16

Load pre-trained VGG16 model as base.

Extract features

- train_features = np.reshape(train_features, (40, 7 + 7 + 512)) validition_features = np.reshape(traition_features, (60, 7 + 7 + 512)) test_features = np.reshape(test_features, (60, 7 + 7 + 512))
 np.shape(train_features)
- □+ (480, 25088)
- Add densely connected classifier

The missing one...

Does it really learn?

Some technicals

- Use data processing and augmentation.
- Batch size is 10.
- Training for 80 epochs.
- Optimizer is RMSprop with learning rate $2e^{-5}$.

Future direction:

- Try model ensemble.
- Try batch normalization.
- Try dynamical rate adjustment.
- Try other pre-trained models (tried ResNet, not successful.)

Take-away

- ► Transfer learning is powerful.
- ▶ VGG16 is very easy to train (maybe your first choice).
- Go try the Google colab (too good to be true).
- Keras maybe your first choice, easy and effective.
